

Team All Traffic Solutions

Fairfax County Transportation and Mobility Hackathon

Our History

- All Traffic Solutions is a provider of Cloud Connected IOT traffic devices.
- We provide product and services for
 - Variable Messaging
 - Traffic Calming
 - Virtual Traffic Studies
 - Counting and classifying of live traffic

What led us to this Idea

- For years we have been collecting traffic data (not used in hackathon)
- We are always looking for ways to leverage this data to make roads safer and more convenient.
- Open data allowed us to correlate traffic events with many non-traffic related events

Uber 1M riders/ day

Total Crashes by Year by Month

Collision Type by Month by Year

Month of Date

Year

2010

 2016

Collision Type

- 1. Rear End
- 2. Angle
- 3. Head On
- 4. Sideswipe - Same ..
- 5. Sideswipe - Oppos..
- 6. Fixed Object in Ro..
- 8. Non-Collision
- 9. Fixed Object - Off ..
- 10. Deer
- 11. Other Animal
- 12. Ped
- 13. Bicyclist
- 14. Motorcyclist
- 15. Backed Into
- 16. Other
- Not Provided

Rush hour ideas

- Educational Campaigns
- Road Side messages
- Roving Enforcement

The Goal Became Clear

- How do I get to work without dying
- We attempted to devise a way to determine the safest way to work

Self Imposed Limits

- Intersection based traffic incidents
- Limited ourselves to 20 intersections as a sample set
- Disregarded the many other interesting avenues of discovery were present in the data

Our Approach

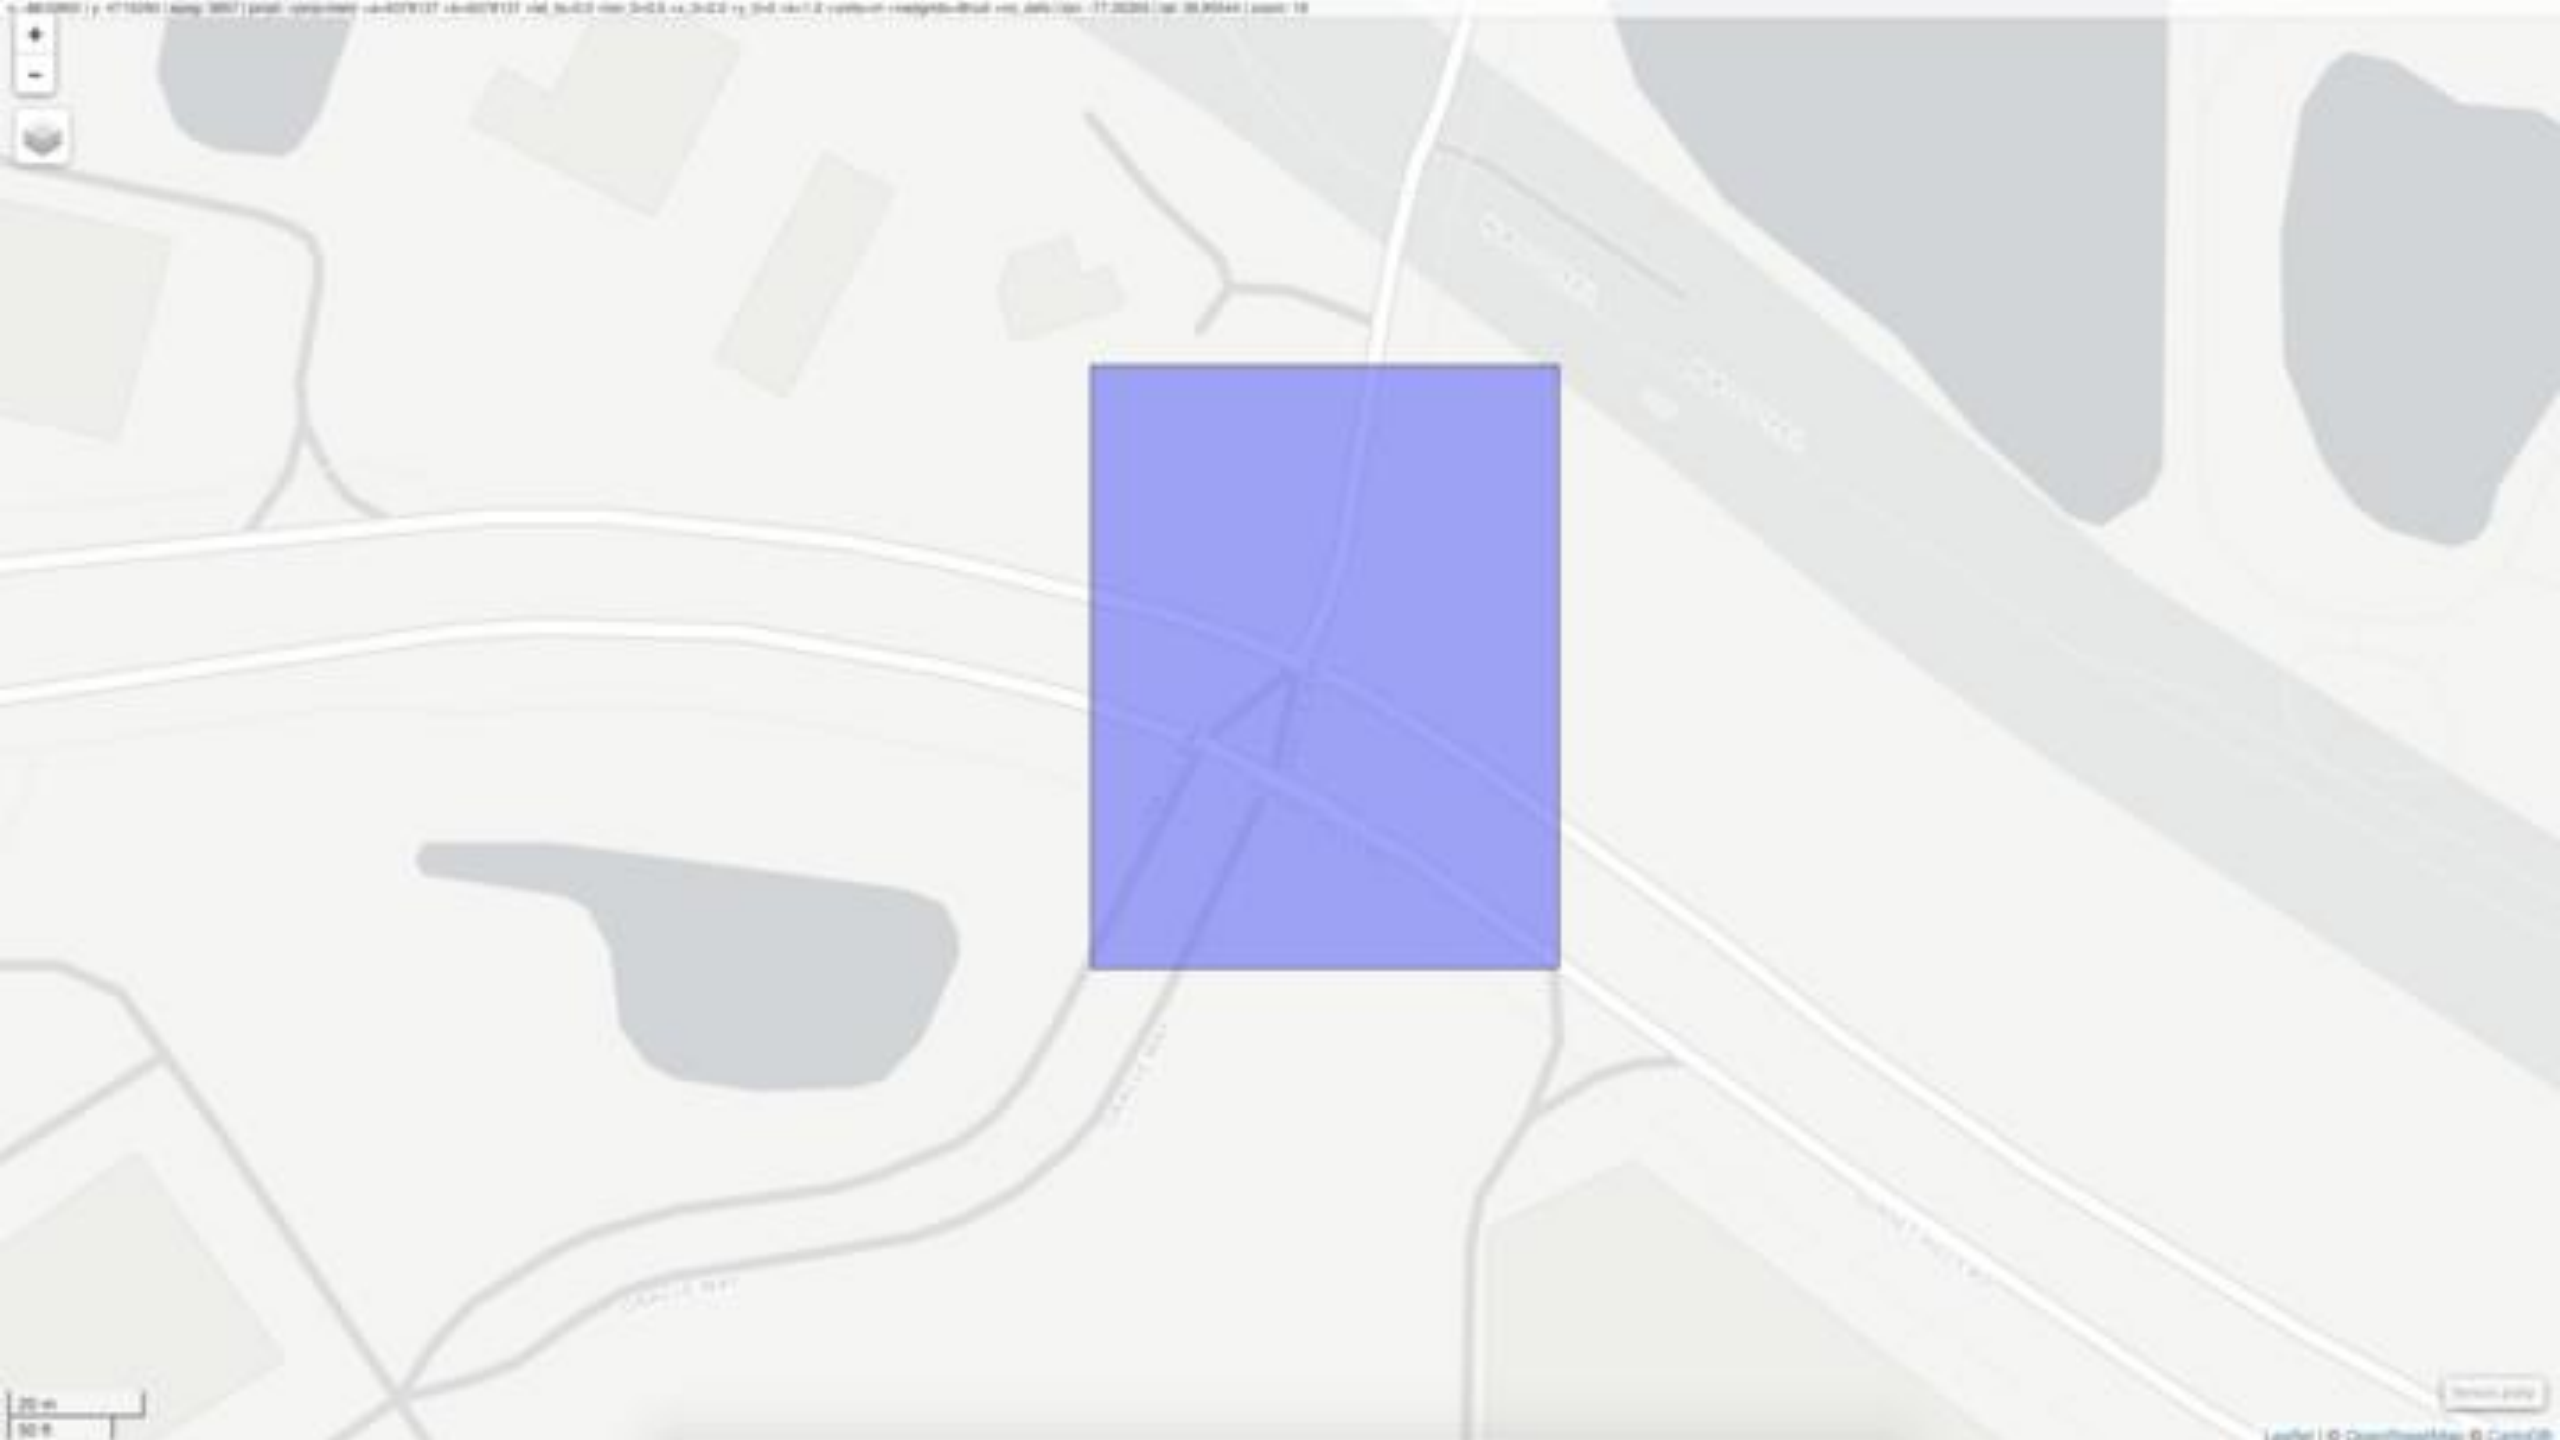

- Using Smarter Roads Data
 - Using Lat/Long of intersections created an overlay with a polygon around each intersection
 - Determined volume of cars in each intersection by an intercept polygon and the ADT of road vector
 - Ran an analysis to determine crashes that occurred in each polygon
- With this data set we were able to determine and rank the intersections based on the crashes per x/cars

1 km
3000 ft

13	0.100042668	2.026658653	🦠🦠
14	0.285387	1.340037939	🦠
15	0.134351419	0.736907783	
16	0.22995784	0.00326452	

What did we do

- We created an automated and parametrized process to objectively rank and classify all the intersections in Virginia for safety.
- In the process we were able to create an key bound link between crash data and road data.

So ... What now ?

- Now that we have the a join of intersection properties and crash data;
 - We look for identifying properties of risk environments.
 - We can prioritize where to apply resources
 - We can deploy live feedback devices to mitigate risk when it is need
- These insights could lead to
 - How they differ from non-risk intersections of similar layout
 - IFTTT notification to cars via DSRC, traditional messaging, or other
 - Improved guidelines for creating lower risk intersections
 - Time and condition responsive, predictive heat maps

Data Sources Used

- Smarter Roads – Crash Data
- Smarter Roads – Traffic Volume Data
- VA Roads – shape file, csv for Intersections and visualization
