The bathymetric survey was performed by Waterway Surveys and Engineering in May 2010. The survey results were compared to a previous survey prepared by the same firm in 2011. The results show an approximate accumulation of 55,000 cubic yards of silt within the limits of the pond survey.

Notes:
1. Depths are in feet relative to mean lower low water.
2. Debits in cubic yards, where the survey at each end of the channel is shown in brackets.
3. Maximum depth at point of measurement in feet.
4. Waterway Surveys' use of an assumed depth.
5. Contours re-evaluated in 2 feet.
